

# Business and Mathematics: A Saga of 25 Years of Progress in Optimization

Robert E. Bixby

**GUROBI**  
OPTIMIZATION

# A Short Bio

- ▶ 1972: Ph.D. Operations Research, Cornell
- ▶ 1972–1985: Very theoretical research in OR
- ▶ 1980: IBM PCs introduced, began computational work
  - 1983–84: Began work on CPLEX
- ▶ 1988: Founded CPLEX optimization
  - Cofounder: Janet Lowe
  - 1992: Market leader, displacing IBM
  - 1997: Sold to ILOG for \$30M, value of deal \$60M
- ▶ 2008: Founded Gurobi optimization
  - Cofounders: Zonghao Gu, Ed Rothberg

# Outline

- ▶ Progress in Optimization
  - Short history of Linear Programming
    - Computational advances
  - Mixed-integer programming
    - What it is and why it's useful
    - How MIP is perceived in many communities
    - Computational progress
- ▶ A story of two companies
  - CPLEX Optimization
  - Gurobi Optimization
- ▶ Closing words of wisdom

# Linear Programming

# Linear Programming History

- ▶ George Dantzig, 1947
  - Introduced LP
  - Invented “primal” simplex algorithm.
  - First LP solved: Laderman (1947), 9 cons., 77 vars., 120 MAN-DAYS
  - Four Nobel Prizes in LP
- ▶ Commercial Developments
  - 1951: first computer implementations of simplex algorithm
  - 1960: LP becomes commercially viable (oil industry)
  - 1972: IBM MPSX/370 introduced, dominates commercial landscape
  - Mid 1980s: market stagnated, LP considered a “done subject”

# They were **WRONG**: LP was far from finished

## A Production Planning Model

401,640 cons. 1,584,000 vars. 9,498,000 nonzeros

### Solution time line (2.0 GHz P4):

		Speedup
◦ 1988 (CPLEX 1.0):	29.8 days	<b>1x</b>
◦ 1997 (CPLEX 5.0):	1.5 hours	<b>480x</b>
◦ 2003 (CPLEX 9.0):	59.1 seconds	<b>43500x</b>

**LP Today:** LP is considered a solved problem by practitioners.

# Mixed-Integer Programming

# A Definition

A *mixed-integer program* (MIP) is an optimization problem of the form

$$\begin{array}{ll} \text{Minimize} & c^T x \\ \text{Subject to} & Ax = b \\ & l \leq x \leq u \\ & \text{some or all } x_j \text{ integer} \end{array}$$

# Customer Applications (2013)

- ▶ Accounting
- ▶ Advertising
- ▶ Agriculture
- ▶ Airlines
- ▶ ATM provisioning
- ▶ Compilers
- ▶ Defense
- ▶ **Electrical power**
- ▶ **Energy**
- ▶ **Finance**
- ▶ Food service
- ▶ Forestry
- ▶ Gas distribution
- ▶ Government
- ▶ Internet applications
- ▶ **Logistics/supply chain**
- ▶ Medical
- ▶ Mining
- ▶ National research labs
- ▶ Online dating
- ▶ Portfolio management
- ▶ Railways
- ▶ Recycling
- ▶ Revenue management
- ▶ Semiconductor
- ▶ Shipping
- ▶ Social networking
- ▶ Sourcing
- ▶ Sports betting
- ▶ Sports scheduling
- ▶ Statistics
- ▶ Steel Manufacturing
- ▶ Telecommunications
- ▶ Transportation
- ▶ Utilities
- ▶ **Workforce Management**

# Solving MIPs

# The Perception

- ▶ Electrical Power
  - ERPI GS-6401, June 1989: Mixed-integer programming (MIP) is a powerful modeling tool, “They are, however, theoretically complicated and computationally cumbersome”. In other words: MIP is an interesting “toy”, but it just doesn’t work in practice.
- ▶ Computer Science
  - “MIP is NP-hard. Really the only choice is to use heuristics.”
- ▶ Story from INFORMS San Francisco
  - Several management science experts (as reported by a Gurobi user)
    - “MIP? Do people still work on that? I thought that was abandoned in the 80s?”

**This Perception is Just Plain  
WRONG**

# Example: Supply-chain scheduling

A Consulting Engagement: Early 1997

- ▶ **Model description:**
  - Weekly model, daily buckets: Objective to minimize end-of-day inventory.
  - Production (single facility), inventory, shipping (trucks), wholesalers (demand known)
- ▶ **Initial modeling phase**
  - Simplified prototype + complicating constraints (production run grouping req't, min truck constraints)
  - **RESULT: Couldn't get good feasible solutions.**
- ▶ **Decomposition approach**
  - Talk to current scheduling team: They first decide on "producibles" schedule. Simulate using heuristics.
  - **Fixed model: Fix variables and run MIP**

# Example: Supply-chain scheduling (cont.)

## CPLEX 5.0 (1997):

```
Integer optimal solution (0.0001/0): Objective = 1.5091900536e+05  
Current MIP best bound = 1.5090391809e+05 (gap = 15.0873)  
Solution time = 3465.73 sec. Iterations = 7885711 Nodes = 489870 (2268)
```

## CPLEX 11.0 (2007):

```
Implied bound cuts applied: 60  
Flow cuts applied: 85  
Mixed integer rounding cuts applied: 41  
Gomory fractional cuts applied: 29
```

```
MIP - Integer optimal solution: Objective = 1.5091900536e+05  
Solution time = 0.63 sec. Iterations = 2906 Nodes = 12
```

**Original model:** CPLEX 11 solved to optimality in 15 minutes (20% improvement in solution quality).

# MIP Computational History: 1950 –1998

- **1954 Dantzig, Fulkerson, S. Johnson: 42 city TSP**
  - Solved to optimality using LP and cutting planes
- **1957 Gomory**
  - Cutting plane algorithms
- **1960 Land, Doig; 1965 Dakin**
  - B&B
- **1964–68 LP/90/94**
  - First commercial application
- **IBM 360 computer**
  - 1974 MPSX/370
  - 1976 Sciconic
    - LP-based B&B
    - MIP became commercially viable
- **1975 – 1998 Good B&B** remained the state-of-the-art in commercial codes, in spite of ....
  - Edmonds, polyhedral combinatorics
  - 1973 Padberg, cutting planes
  - 1973 Chvátal, revisited Gomory
  - 1974 Balas, disjunctive programming
  - 1983 Crowder, Johnson, Padberg: PIPX, pure 0/1 MIP
  - 1987 Van Roy and Wolsey: MPSARX, mixed 0/1 MIP
  - TSP, Grötschel, Padberg, ...

# 1998 ... A New Generation of MIP Codes

- Linear programming
  - Stable, robust dual simplex
- Variable/node selection
  - Influenced by traveling salesman problem
- Primal heuristics
  - 12 different tried at root
  - Retried based upon success
- Node presolve
  - Fast, incremental bound strengthening (very similar to Constraint Programming)
- Presolve – numerous small ideas
  - Probing in constraints:  
$$\sum x_j \leq (\sum u_j) y, \quad y = 0/1$$
$$\rightarrow x_j \leq u_j y \text{ (for all } j)$$
- Cutting planes
  - Gomory, mixed-integer rounding (MIR), knapsack covers, flow covers, cliques, GUB covers, implied bounds, zero-half cuts, path cuts

# Some Test Results – from 2008

- ▶ **Test set: 1 852 real-world MIPs**
  - Full library
    - 2791 MIPs
  - Removed:
    - 559 “Easy” MIPs
    - 348 “Duplicates”
    - 22 “Hard” LPs (0.8%)
- ▶ **Parameter settings**
  - Pure defaults
  - 30000 second time limit
- ▶ **Versions Run**
  - CPLEX 1.2 (1991) -- CPLEX 11.0 (2007)

# MIP Speedups

# CPLEX MIP Speedups 1991-2008

# Gurobi MIP Speedups 2009-2014

- ▶ Gurobi 1.0 and CPLEX 11.0 roughly equivalent
- ▶ Gurobi version-to-version improvements
  - Gurobi 1.0 → 6.0: 29.4X
- ▶ **Overall improvement: 1990 to 2014**
  - **Algorithms:** 870,000x
  - **Machines:** 6,500x
  - **NET: Algorithm x Machine** 5,600,000,000x  
(180 years / 5.6B  $\approx$  1 second)

# Founding Two Companies

# CPLEX Optimization: The Start

- ▶ 1982–1987: Initial code development
  - Wrote classroom code
  - Code adopted by Chesapeake Decisions Sciences
    - Early supply chain company, founded by Tom Baker
    - Really remained a hobby
  - Purchased by Amaco 1986
  - *I realized I had something of value, and that I was pretty good at this odd mixture of mathematics, numerics, and computer science*
- ▶ 1988: CPLEX Optimization incorporated
  - Cofounded with Janet Lowe

# CPLEX Optimization: Why was it successful?

- ▶ **Willingness to take RISKS**
  - I realized I didn't know how to start a business (1988)
  - I invited Janet and Todd Lowe to join, and had to give them ½ the business
- ▶ **Developed a VISION**
  - I realized that important work was going on, and this work needed an embeddable solver
  - This led to the notion of a *callable library and an object oriented design*, and this was a perfect fit for the industrial applications of the future
- ▶ **Developed new commercial opportunities for solvers**
  - The OEM model for solvers: embed your solver in other software, and let other companies do the selling for you
- ▶ **Business Execution**
  - We ran circles around IBM on customer care (support, licensing, pricing)
- ▶ **Performance and *numerical stability***
  - CPLEX was just a good solver
- ▶ **Result:**
  - By the late 1990s, CPLEX was completely dominant in its space
  - Sold to ILOG for \$30M

# Gurobi Optimization: Back to Basics

- ▶ Cofounded is 2008
  - Our goal: Make our customers successful with optimization
- ▶ Back to Basics
  - Business execution
    - The best product support
    - The most flexible pricing and licensing
  - The best possible performance
    - Get the best people, and focus on this goal
  - Product innovation
    - Cloud offering, client-server offering, distributed computing
- ▶ Where we are now
  - Growing faster than CPLEX (revenues exceed those after 10 years)
  - 17 people (CPLEX had 13 when it was sold in 1997)
  - Distributors in four countries
  - Branch office in Germany
  - The top three developers in the industry

# Gurobi: Three applications

- ▶ NFL
  - 2014 schedule was computed using Gurobi
  - They “solve” a single, very-difficult MIP
  - Computed 24x7 from the day after the Super Bowl until schedule release
    - Running on 800 cores
  - Produced 5–10 “good” schedules from which the owners chose one.
- ▶ New York ISO (NYISO)
  - Manages electrical-power generation in greater NY area (~1500 units)
  - Solve day-ahead unit-commitment, day-of-operation dispatch, and spot-pricing models
    - Running on 100 clients, 6 servers (using client-server model)
    - Pricing LP is solved every 5 minutes throughout the day
- ▶ eHarmony
  - Once per week eHarmony computes and “optimal” world-wide matching
  - The underlying MIP has 115 million variables and 40 million constraints
    - Solve time: approximately two hours
  - Model was built by a psychology PhD!!

# Building a Successful Business

Three key ideas:

- ▶ Be prepared to take calculated risks
- ▶ Get the right people
- ▶ Objectively evaluate your markets
