By with for B(X)

Corollary 2.2: Let X and Y be topological spaces (or metric spaces),  $\mathcal{B}(X)$  and  $\mathcal{B}(X)$  be Borel sets. If  $f: X \to Y$  is continuous, then f is  $(\mathcal{B}(X), \mathcal{B}(X))$ -measurable.

Proof: Let X and Y be topological spaces (or metric spaces),  $\mathcal{B}_X$  and  $\mathcal{B}_Y$  be Borel sets and  $f: X \to Y$  be continuous. Let  $\mathcal{E}$  be the collection of open subsets of Y. Then,  $\mathcal{E}$  generates  $\mathcal{B}_Y$ . Let  $U \in \mathcal{E}$ , then  $f^{-1}(U)$  is open in X because f is continuous. This implies that  $f^{-1}(U) \in \mathcal{B}_X$ . Thus, by Proposition 2.1, f is  $(\mathcal{B}_X, \mathcal{B}_Y)$ - measurable.

Shorthand: Let  $(X, \mathcal{M})$  be a measurable space and  $f: X \to \mathbb{R}$ , then we say that f is  $\mathcal{M}$ -measurable or measurable to mean that f is  $(\mathcal{M}, \mathcal{B}_{\mathbb{R}})$ -measurable. That is  $f^{-1}(B) \in \mathcal{M}$  for B, the Borel sets of  $\mathbb{R}$ .

**Proposition 2.3**: Let  $(X, \mathcal{M})$  be a measurable space and  $f: X \to \mathbb{R}$ . Then the following statements are equivalent:

- (a) f is  $\mathcal{M}$ -measurable.
- (b)  $f^{-1}((a, +\infty)) \in \mathcal{M}$  for all  $a \in \mathbb{R}$ .
- (c)  $f^{-1}([a, +\infty)) \in \mathcal{M}$  for all  $a \in \mathbb{R}$ .
- (d)  $f^{-1}((-\infty, a)) \in \mathcal{M}$  for all  $a \in \mathbb{R}$ .
- (e)  $f^{-1}((-\infty, a]) \in \mathcal{M}$  for all  $a \in \mathbb{R}$ .

Proof:  $((a) \Rightarrow (b))$  Suppose that f is  $(\mathcal{M}, \mathcal{B}_{\mathbb{R}})$ -measurable. Then,  $(a, +\infty) \in \mathcal{B}_{\mathbb{R}}$  implies that  $f^{-1}((a, +\infty)) \in \mathcal{M}$ .  $((b) \Rightarrow (a))$  We have shown earlier that the sets of the form  $\mathcal{E} = \{(a, +\infty) : a \in \mathbb{R}\}$  generate  $\mathcal{B}_{\mathbb{R}}$ . Thus, by Proposition 2.1, f is  $(\mathcal{M}, \mathcal{B}_{\mathbb{R}})$ -measurable.

Note: The rest of the proofs are similar. Use that fact that the given collections generate the Borel sets.

Composition

**Note 1**: Suppose that  $f, g : \mathbb{R} \to \mathbb{R}$ , and they are both  $\mathcal{B}_{\mathbb{R}}$ -measurable. This means that if  $B \in \mathcal{B}_{\mathbb{R}}$ , then  $f^{-1}(B), g^{-1}(B) \in \mathcal{B}_{\mathbb{R}}$ . Then, if  $f \circ g : \mathbb{R} \to \mathbb{R}$  and  $B \in \mathcal{B}_{\mathbb{R}}$ , then  $(f \circ g)^{-1}(B) = g^{-1}(f^{-1}(B)) \in \mathcal{B}_{\mathbb{R}}$ . Thus,  $f \circ g$  is  $\mathcal{B}_{\mathbb{R}}$ -measurable.

**Note 2**: Let  $\mathcal{L}$  be the collection of Lebesgue sets. Suppose that  $f,g:\mathbb{R}\to\mathbb{R}$  and they are both  $\mathcal{L}$ -measurable. That is if  $B\in\mathcal{B}_{\mathbb{R}}$ , then  $f^{-1}(B),g^{-1}(B)\in\mathcal{L}$ . Now consider  $f\circ g:\mathbb{R}\to\mathbb{R}$  and let  $B\in\mathcal{B}_{\mathbb{R}}$ . Now,  $(f\circ g)^{-1}(B)=g^{-1}(f^{-1}(B))$  and  $f^{-1}(B)\in\mathcal{L}$ , but  $f^{-1}(B)$  may not be a Borel set. Thus, in general,  $(f\circ g)^{-1}(B)=g^{-1}(f^{-1}(B))\notin\mathcal{L}$ . That is,  $f\circ g$  need not be  $\mathcal{L}$ -measurable. In fact such examples that

**Definition**: Let  $E \subseteq X$ . Then the function  $\chi_E : X \to \mathbb{R}$  defined by

$$\chi_{\scriptscriptstyle E}(x) = \left\{ egin{array}{ll} 1 & ext{if } x \in E \ 0 & ext{if } x 
otin E \end{array} 
ight.$$

is called the **characteristic function** of the set E.

**Proposition**: Let  $(X, \mathcal{M})$  be a measurable space, and  $E \subseteq X$ . Then,

Proposition: Let 
$$(X, \mathcal{M})$$
 be a measurable space, and  $E \subseteq X$ . Then,  $\chi_E : X \to \mathbb{R}$  is  $\mathcal{M}$ -measurable if and only if  $E \in \mathcal{M}$ .

Proof:  $\chi_E$  is measurable  $\Leftrightarrow \chi_E^{-1}(B) \in \mathcal{M}$  for all  $B \in \mathcal{B}_{\mathbb{R}}$ . But, 
$$\chi_E^{-1}(B) = \begin{cases} \emptyset & \text{if } \mathcal{B}, \text{if } \mathcal{B} \\ E & \text{if } \mathcal{B}, \text{if } \mathcal{B} \end{cases}$$

$$\chi_E^{-1}(B) = \begin{cases} \emptyset & \text{if } \mathcal{B}, \text{if } \mathcal{B} \\ E & \text{if } \mathcal{B}, \text{if } \mathcal{B} \end{cases}$$

$$\chi_E^{-1}(B) = \begin{cases} 0 & \text{if } \mathcal{B} \\ E & \text{if } \mathcal{B}, \text{if } \mathcal{B} \end{cases}$$

$$\chi_E^{-1}(B) = \begin{cases} 0 & \text{if } \mathcal{B} \\ E & \text{if } \mathcal{B}, \text{if } \mathcal{B} \end{cases}$$

$$\chi_E^{-1}(B) = \begin{cases} 0 & \text{if } \mathcal{B} \\ E & \text{if } \mathcal{B}, \text{if } \mathcal{B} \end{cases}$$

$$\chi_E^{-1}(B) = \begin{cases} 0 & \text{if } \mathcal{B} \\ E & \text{if } \mathcal{B}, \text{if } \mathcal{B} \end{cases}$$

$$\chi_E^{-1}(B) = \begin{cases} 0 & \text{if } \mathcal{B} \\ E & \text{if } \mathcal{B}, \text{if } \mathcal{B} \end{cases}$$

$$\chi_E^{-1}(B) = \begin{cases} 0 & \text{if } \mathcal{B} \\ E & \text{if } \mathcal{B}, \text{if } \mathcal{B} \end{cases}$$

$$\chi_E^{-1}(B) = \begin{cases} 0 & \text{if } \mathcal{B} \\ E & \text{if } \mathcal{B} \end{cases}$$

$$\chi_E^{-1}(B) = \begin{cases} 0 & \text{if } \mathcal{B} \\ E & \text{if } \mathcal{B} \end{cases}$$

$$\chi_E^{-1}(B) = \begin{cases} 0 & \text{if } \mathcal{B} \\ E & \text{if } \mathcal{B} \end{cases}$$

$$\chi_E^{-1}(B) = \begin{cases} 0 & \text{if } \mathcal{B} \\ E & \text{if } \mathcal{B} \end{cases}$$

$$\chi_E^{-1}(B) = \begin{cases} 0 & \text{if } \mathcal{B} \\ E & \text{if } \mathcal{B} \end{cases}$$

$$\chi_E^{-1}(B) = \begin{cases} 0 & \text{if } \mathcal{B} \\ E & \text{if } \mathcal{B} \end{cases}$$

$$\chi_E^{-1}(B) = \begin{cases} 0 & \text{if } \mathcal{B} \\ E & \text{if } \mathcal{B} \end{cases}$$

$$\chi_E^{-1}(B) = \begin{cases} 0 & \text{if } \mathcal{B} \\ E & \text{if } \mathcal{B} \end{cases}$$

$$\chi_E^{-1}(B) = \begin{cases} 0 & \text{if } \mathcal{B} \\ E & \text{if } \mathcal{B} \end{cases}$$

$$\chi_E^{-1}(B) = \begin{cases} 0 & \text{if } \mathcal{B} \\ E & \text{if } \mathcal{B} \end{cases}$$

$$\chi_E^{-1}(B) = \begin{cases} 0 & \text{if } \mathcal{B} \\ E & \text{if } \mathcal{B} \end{cases}$$

$$\chi_E^{-1}(B) = \begin{cases} 0 & \text{if } \mathcal{B} \\ E & \text{if } \mathcal{B} \end{cases}$$

$$\chi_E^{-1}(B) = \begin{cases} 0 & \text{if } \mathcal{B} \\ E & \text{if } \mathcal{B} \end{cases}$$

$$\chi_E^{-1}(B) = \begin{cases} 0 & \text{if } \mathcal{B} \\ E & \text{if } \mathcal{B} \end{cases}$$

$$\chi_E^{-1}(B) = \begin{cases} 0 & \text{if } \mathcal{B} \\ E & \text{if } \mathcal{B} \end{cases}$$

$$\chi_E^{-1}(B) = \begin{cases} 0 & \text{if } \mathcal{B} \\ E & \text{if } \mathcal{B} \end{cases}$$

$$\chi_E^{-1}(B) = \begin{cases} 0 & \text{if } \mathcal{B} \\ E & \text{if } \mathcal{B} \end{cases}$$

$$\chi_E^{-1}(B) = \begin{cases} 0 & \text{if } \mathcal{B} \\ E & \text{if } \mathcal{B} \end{cases}$$

$$\chi_E^{-1}(B) = \begin{cases} 0 & \text{if } \mathcal{B} \\ E & \text{if } \mathcal{B} \end{cases}$$

$$\chi_E^{-1}(B) = \begin{cases} 0 & \text{if } \mathcal{B} \\ \mathcal{B} \end{cases}$$

$$\chi_E^{-1}(B) = \begin{cases} 0 & \text{if } \mathcal{B} \\ \mathcal{B} \end{cases}$$

$$\chi_E^{-1}(B) = \begin{cases} 0 & \text{if } \mathcal{B} \\ \mathcal{B} \end{cases}$$

$$\chi_E^{-1}(B) = \begin{cases} 0 & \text{if } \mathcal{B} \\ \mathcal{B} \end{cases}$$

$$\chi_E^{-1}(B) = \begin{cases} 0 & \text{if } \mathcal{B} \\ \mathcal{B} \end{cases}$$

$$\chi_E^{-1}(B) = \begin{cases} 0 & \text{$$

**Example:** Recall h(x) = x + f(x) where f is ternary, and  $h: [0.1] \rightarrow$ [0.2] is a homeomorphism. If  $C \subseteq [0,1]$  is a Cantor set, then h(C)has measure 1.

So, there exist  $E\subseteq h(C)$  such that E is non-measurable. Pick Esuch that  $0 \notin E$  and  $2 \notin E$ . Let  $B = h^{-1}(E) \subseteq C$ . Then, B is measurable,  $0 \notin B$  and  $1 \notin B$ . So,  $h^{-1}: [0,2] \to [0,1]$  is continuous and can be extended to  $b: \mathbb{R} \to \mathbb{R}$  defined by

$$b(x) = \begin{cases} 0 & \text{if } x < 0\\ h^{-1}(x) & \text{if } 0 \le x \le 2\\ 1 & \text{if } 2 < x \end{cases}$$

Thus, b is continuous on  $\mathbb{R}$  implies that b is  $(\mathcal{B}_{\mathbb{R}}, \mathcal{B}_{\mathbb{R}})$ -measurable. Note that  $\chi_B$  is  $(\mathcal{L}, \mathcal{B}_{\mathbb{R}})$ -measurable. Now, consider  $(\chi_B \circ b)^{-1}(\{1\})$  =  $\{x: (\chi_B \circ b)(x) = 1\} = \{x: b(x) \in B\} = \{x: h^{-1}(x) \in B\} = (h^{-1})^{-1}(B) = h(B) = E$  which is non-measurable. Thus,  $\chi_B \circ b$  is not  $(\mathcal{L}, \mathcal{B}_{\scriptscriptstyle D})$ -measurable.

**Idea of Finite Products**: Given measurable spaces  $(Y_1, \mathcal{N}_1)$  and  $(Y_2, \mathcal{N}_2)$ . We want a  $\sigma$ -algebra on the product space  $Y_1 \times Y_2$ . To define such a  $\sigma$ algebra, look at the  $\sigma$ -algebra generated by all sets of the form  $\{B_1 \times B_2 :$  $B_1 \in \mathcal{N}_1$  and  $B_2 \in \mathcal{N}_2$ . This  $\sigma$ -algebra is denoted by  $\mathcal{N}_1 \otimes \mathcal{N}_2$ .

has So, such mea and DM17

Thu Not

**Proposition**: Let  $Y_1 = Y_2 = \mathbb{R}$  and  $\mathcal{N}_1 = \mathcal{N}_2 = \mathcal{B}_{\mathbb{R}}$ . Then,  $Y_1 \times Y_2 = \mathbb{R}^2$  and  $\mathcal{B}_{\mathbb{R}} \otimes \mathcal{B}_{\mathbb{R}} = \mathcal{B}_{\mathbb{R}^2}$ .

Proof: [Show that  $\mathcal{B}_{_{\mathbb{R}^2}}\subseteq\mathcal{B}_{_{\mathbb{R}}}\otimes\mathcal{B}_{_{\mathbb{R}}}.$ ]

Let  $O \in \mathbb{R}^2$  be open. Look at rectangles  $(p_1,q_1) \times (p_2,q_2) \subseteq O$  such that  $p_i,q_i \in \mathbb{Q}$ . Since O is open,  $O = \bigcup \{(p_1,q_1) \times (p_2,q_2) : p_i,q_i \in \mathbb{Q} \text{ and } (p_1,q_1) \times (p_2,q_2) \subseteq O\}$ . Then, this is a countable union. But,  $(p_i,q_i) \in \mathcal{B}_{\mathbb{R}} \Rightarrow (p_1,q_1) \times (p_2,q_2) \in \mathcal{B}_{\mathbb{R}} \otimes \mathcal{B}_{\mathbb{R}} \Rightarrow O \in \mathcal{B}_{\mathbb{R}} \otimes \mathcal{B}_{\mathbb{R}}$ . Since open sets generates  $\mathcal{B}_{\mathbb{R}^2}$ ,  $\mathcal{B}_{\mathbb{R}^2} \subseteq \mathcal{B}_{\mathbb{R}} \otimes \mathcal{B}_{\mathbb{R}}$ .

[Show that  $\mathcal{B}_{\mathbb{R}} \otimes \mathcal{B}_{\mathbb{R}} \subseteq \mathcal{B}_{\mathbb{R}^2}$ .]

It is enough to show that if  $B_1, B_2 \in \mathcal{B}_{\mathbb{R}}$ , then  $B_1 \times B_2 \in \mathcal{B}_{\mathbb{R}^2}$ . Let  $\mathcal{A} = \{E \subseteq \mathbb{R} : E \times \mathbb{R} \in \mathcal{B}_{\mathbb{R}^2}\}$ . Note that  $\emptyset \in \mathcal{A}, \mathbb{R} \in \mathcal{A}$ , and  $E \in \mathcal{A} \Rightarrow E \times \mathbb{R} \in \mathcal{B}_{\mathbb{R}^2} \Rightarrow (E \times \mathbb{R})^c \in \mathcal{B}_{\mathbb{R}^2}$ . But,  $(E \times \mathbb{R})^c = E^c \times \mathbb{R} \Rightarrow E^c \in \mathcal{A}$ . Finally,  $E_n \in \mathcal{A} \Rightarrow E_n \times \mathbb{R} \in \mathcal{B}_{\mathbb{R}^2} \Rightarrow \bigcup_n (E_n \times \mathbb{R}) \in \mathcal{B}_{\mathbb{R}^2}$ . But,  $\bigcup_n (E_n \times \mathbb{R}) = (\bigcup_n E_n) \times \mathbb{R} \Rightarrow \bigcup_n E_n \in \mathcal{A}$ .

Thus, A is a  $\sigma$ -algebra.

If we do the following:  $(a,b) \times \mathbb{R} \in \mathcal{B}_{\mathbb{R}^2} \Rightarrow (a,b) \in \mathcal{A}$ . Thus,  $\mathcal{B}_{\mathbb{R}} \subseteq \mathcal{A}$ . Hence, if  $B \in \mathcal{B}_{\mathbb{R}}$ , then  $B \times \mathbb{R} \in \mathcal{B}_{\mathbb{R}^2}$ . Similarly, if  $B \in \mathcal{B}_{\mathbb{R}}$ , then  $\mathbb{R} \times B \in \mathcal{B}_{\mathbb{R}^2}$ . Hence,  $B_1 \times B_2 = (B_1 \times \mathbb{R}) \cap (\mathbb{R} \times B_2) \in \mathcal{B}_{\mathbb{R}^2}$ . This shows that  $\mathcal{B}_{\mathbb{R}} \otimes \mathcal{B}_{\mathbb{R}} \subseteq \mathcal{B}_{\mathbb{R}^2}$ , and so  $\mathcal{B}_{\mathbb{R}} \otimes \mathcal{B}_{\mathbb{R}} = \mathcal{B}_{\mathbb{R}^2}$ .

**Proposition 2.4**: (Case n=2) Given  $(X,\mathcal{M}), (Y_1,\mathcal{N}_1)$ , and  $(Y_2,\mathcal{N}_2)$ , and also  $f_1:X\to Y_1$  and  $f_2:X\to Y_2$ , define  $f:X\to Y_1\times Y_2$  by  $f(x)=(f_1(x),f_2(x))$ . Then, f is  $(\mathcal{M},\mathcal{N}_1\otimes\mathcal{N}_2)$ -measurable if and only if  $f_i$  is  $(\mathcal{M},\mathcal{N}_i)$ -measurable for each i=1,2.

Proof:  $(\Rightarrow)$  Given  $B_1 \in \mathcal{N}_1 \Rightarrow B_1 \times Y_2 \in \mathcal{N}_1 \times \mathcal{N}_2 \Rightarrow f^{-1}(B_1 \times Y_2) \in \mathcal{M}$ . But,  $f^{-1}(B_1 \times Y_2) = \{x: f(x) \in B_1 \times Y_2\} = \{x: (f_1(x), f_2(x)) \in B_1 \times Y_2\} = \{x: f_1(x) \in B_1\} = f_1^{-1}(B_1)$ . Thus,  $f_1^{-1}(B_1) \in \mathcal{M}$ , and so  $f_1$  is  $(\mathcal{M}, \mathcal{N}_1)$ -measurable. Similarly,  $f_2$  is  $(\mathcal{M}, \mathcal{N}_2)$ -measurable.  $(\Leftarrow)$  Let  $\mathcal{A} = \{B \in Y_1 \times Y_2: f^{-1}(B) \in \mathcal{M}\}$ . It is easy to show that  $\mathcal{A}$  is a  $\sigma$ -algebra. Let  $B_i \in \mathcal{N}_i$ . Then,  $B_1 \times B_2 = (B_1 \times Y_2) \cap (Y_1 \times B_2) \Rightarrow f^{-1}(B_1 \times B_2) = f^{-1}(B_1 \times Y_2) \cap f^{-1}(Y_1 \times B_2)$ . Now,  $f^{-1}(B_1 \times Y_2) = \{x: f(x) \in B_1 \times Y_2\} = \{x: f_1(x) \in B_1\} = f_1^{-1}(B_1) \in \mathcal{M} \Rightarrow B_1 \times Y_2 \in \mathcal{A}$ , and

similarly  $Y_1 \times B_2 \in \mathcal{A} \Rightarrow B_1 \times B_2 = (B_1 \times Y_2) \cap (Y_1 \times B_2)$  $\in \mathcal{A}$ . Thus,  $\mathcal{N}_1 \otimes \mathcal{N}_2 \subseteq \mathcal{A}$ , and so  $f^{-1}(E) \in \mathcal{M}$  for all  $E \in \mathcal{N}_1 \otimes \mathcal{N}_2$ . Therefore, f is  $(\mathcal{M}, \mathcal{N}_1 \otimes \mathcal{N}_2)$ -measurable.

**Proposition 2.6**: Let  $(X, \mathcal{M})$  be measurable. If  $f, g: X \to \mathbb{R}$  are  $(\mathcal{M}, \mathcal{B}_{\mathbb{R}})$ -measurable, then f + g and fg are  $(\mathcal{M}, \mathcal{B}_{\mathbb{R}})$ -measurable.

Proof: Look at  $F: X \to \mathbb{R}^2$  defined by F(x) = (f(x), g(x)). By Proposition 2.4, F is  $(\mathcal{M}, \mathcal{B}_{\mathbb{R}} \otimes \mathcal{B}_{\mathbb{R}})$ -measurable. Let  $s: \mathbb{R}^2 \to \mathbb{R}$  be defined by s((x,y)) = x + y. Then, s is continuous. This implies that s is  $(\mathcal{B}_{\mathbb{R}^2}, \mathcal{B}_{\mathbb{R}})$ -measurable by Corollary 2.2. But,  $\mathcal{B}_{\mathbb{R}} \otimes \mathcal{B}_{\mathbb{R}} = \mathcal{B}_{\mathbb{R}^2}$ . So,  $s \circ F: X \to \mathbb{R}$  is  $(\mathcal{M}, \mathcal{B}_{\mathbb{R}})$ -measurable, and  $(s \circ F)(x) = s((f(x), g(x)) = f(x) + g(x)$ . Thus, f + g is  $(\mathcal{M}, \mathcal{B}_{\mathbb{R}})$ -measurable. Next,  $p: \mathbb{R}^2 \to \mathbb{R}$  be defined by p((a, b)) = ab. Then, p is continuous. By Corollary 2.2, p is  $(\mathcal{B}_{\mathbb{R}^2}, \mathcal{B}_{\mathbb{R}})$ -measurable. So,  $p \circ F: X \to \mathbb{R}$  is  $(\mathcal{M}, \mathcal{B}_{\mathbb{R}})$ -measurable , and  $(p \circ F)(x) = p(f(x), g(x)) = f(x)g(x)$ . Thus, fg is  $(\mathcal{M}, \mathcal{B}_{\mathbb{R}})$ -measurable.

## General Product

Let  $(Y_{\alpha}, \mathcal{N}_{\alpha})$  where  $\alpha \in A$  be measurable spaces. Then,  $Y = \prod_{\alpha \in A} Y_{\alpha}$ 

 $=\{y:y=(y_{\alpha})_{\alpha\in A} \text{ and } y_{\alpha}\in Y_{\alpha}\}.$  Also, the **product \sigma-algebra**, denoted by  $\mathcal{N}=\bigotimes_{\alpha\in A}\mathcal{N}_{\alpha}$ , is the  $\sigma$ -algebra generated by all sets of the

following form:

Pick countably many  $\alpha$ 's, say  $\{\alpha_n\}$ .

For each n, pick  $E_n \in \mathcal{N}_{\alpha_n}$ .

Let  $E = \{y = (y_{\alpha}) : y_{\alpha_n} \in E_n \text{ for all } n\}$  which is called

countable windows. Another set that generates  $\mathcal{N}$ :

Pick one  $\alpha$ , say  $\alpha_1$  and  $E_1 \in \mathcal{N}_{\alpha_1}$ .

Let  $E = \{ y = (y_{\alpha}) : y_{\alpha_1} \in E_1 \}.$ 

They are the same set because:

$$\{y=(y_{\scriptscriptstyle lpha}):y_{\scriptscriptstyle lpha_n}\in E_n ext{ for all } n\}=\bigcap_{n=1}^\infty \{\{y=(y_{\scriptscriptstyle lpha}):y_{\scriptscriptstyle lpha_n}\in E_n\}.$$

**Proposition 2.4**: Let  $(X, \mathcal{M})$  and  $(Y_{\alpha}, \mathcal{N}_{\alpha})$  be measurable spaces, and  $f_{\alpha}: X \to Y_{\alpha}$ . Define  $f: X \to \prod Y_{\alpha}$  by  $f(x) = (f_{\alpha}(x))$ . Then, f is  $(\mathcal{M}, \bigotimes \mathcal{N}_{\alpha})$ -measurable if and only if  $f_{\alpha}$  is  $(\mathcal{M}, \mathcal{N}_{\alpha})$ -measurable for all  $\alpha$ .

OMIT

## Extended Reals

 $\mathbb{R}_{e} = \mathbb{R} \cup \{+\infty\} \cup \{-\infty\}$   $\mathbb{R}_{e} = \{B \subseteq \mathbb{R}_{e} : B \cap \mathbb{R} \in \mathcal{B}_{\mathbb{R}}\}$ 

Note that  $\mathcal{B}_{\mathbb{R}}$  is a  $\sigma$ -algebra, and  $B \in \mathcal{B}_{\mathbb{R}}$  if and only if  $B = B_1$ ,  $B_1 \cup \{+\infty\}$ ,  $B_1 \cup \{-\infty\}$ , or  $B_1 \cup \{+\infty\} \cup \{-\infty\}$  where  $B_1 \in \mathcal{B}_{\mathbb{R}}$ .

**Proposition**: Let  $(X, \mathcal{M})$  be a measurable space and  $f: X \to \mathbb{R}_2$ . Then, following statements are equivalent:

- Ing statements are equivalent:
  (1) f is  $(\mathcal{A}, \mathcal{B})$ -measurable.  $(\mathcal{M}, \mathcal{B}(\mathcal{R}))$ -measurable.
- (2)  $f^{-1}((a, +\infty]) \in \mathcal{M}$  for all  $a \in \mathbb{R}$
- (3)  $f^{-1}([a, +\infty]) \in \mathcal{M}$  for all  $a \in \mathbb{R}$
- (4)  $f^{-1}([-\infty, a)) \in \mathcal{M}$  for all  $a \in \mathbb{R}$
- (5)  $f^{-1}([-\infty, a]) \in \mathcal{M} \text{ for all } a \in \mathbb{R}$

Proof:  $((1) \Rightarrow (2))$  Recall that  $(a, +\infty) = (a, +\infty) \cup \{+\infty\}$ , and  $(a, +\infty) \in \mathcal{B}_{\mathbb{R}}$  implies that  $(a, +\infty) \cup \{+\infty\} \in \mathcal{B}_{\mathbb{R}}$ . Since f is  $(\mathcal{M}, \mathcal{B}_{\mathbb{R}})$ -measurable,  $f^{-1}((a, +\infty)) \in \mathcal{M}$  for all  $a \in \mathbb{R}$ . Similarly,  $(1) \Rightarrow (3)$ ,  $(1) \Rightarrow (4)$ , and  $(1) \Rightarrow (5)$ .  $((2) \Rightarrow (1)$  - sketch) The set of the form  $(a, +\infty)$  generates  $\mathcal{B}_{\mathbb{R}}$ , and  $(a, +\infty)^c = \{-\infty\}$ . Now,  $\{B : f^{-1}(B) \in \mathcal{M}\}$  is a  $\sigma$ -algebra, and a generating set for  $\mathcal{B}_{\mathbb{R}}$ . So, it must contain  $\mathcal{B}_{\mathbb{R}}$ . Thus,  $B \in \mathcal{B}_{\mathbb{R}}$ , then  $f^{-1}(B) \in \mathcal{M}$ , and so f is  $(\mathcal{M}, \mathcal{B}_{\mathbb{R}})$ -measurable. Similarly,  $(3) \Rightarrow (1)$ ,  $(4) \Rightarrow (1)$ , and  $(5) \Rightarrow (1)$  because  $[a, +\infty]$ ,  $[-\infty, a)$  and  $[-\infty, a]$  also generate  $\mathcal{B}_{\mathbb{R}}$ .

**Proposition 2.7**: Let  $(X,\mathcal{M})$  be a measurable space, and  $f_j:X\to\overline{\mathbb{R}}$  be all  $(\mathcal{M},\mathcal{B}_{\overline{\mathbb{R}}})$ -measurable. Then,  $g_1(x)=\sup_j f_j(x),$   $g_2(x)=\inf_j f_j(x),$   $g_3(x)=\lim_j \sup_j f_j(x)$  and  $g_4(x)=\lim_j \inf_j f_j(x)$  are all  $(\mathcal{M},\mathcal{B}_{\overline{\mathbb{R}}})$ -measurable. If  $\lim_i f_j(x)$  exists for all x, then it is also  $(\mathcal{M},\mathcal{B}_{\overline{\mathbb{R}}})$ -measurable.

Proof: [Show that  $g_1$  is  $(\mathcal{M}, \mathcal{B}_{\overline{\mathbb{R}}})$ -measurable.]  $g_1^{-1}((a, +\infty]) = \bigcup_{j=1}^{\infty} f_j^{-1}((a, +\infty]) \in \mathcal{M} \text{ because each } f_j^{-1}((a, +\infty]) \in \mathcal{M}. \text{ Thus, } g_1 \text{ is } (\mathcal{M}, \mathcal{B}_{\overline{\mathbb{R}}}) \text{-measurable.}$  [Show that  $g_2$  is  $g_1$  is  $(\mathcal{M}, \mathcal{B}_{\overline{\mathbb{R}}})$ -measurable.]  $g_2^{-1}([-\infty, a)) = \bigcup_{j=1}^{\infty} f_j^{-1}([-\infty, a)) \in \mathcal{M} \text{ because each } f_j^{-1}([-\infty, a)) \in \mathcal{M}. \text{ Thus, } g_2 \text{ is } (\mathcal{M}, \mathcal{B}_{\overline{\mathbb{R}}}) \text{-measurable.}$ 

[Show that  $g_3$  is  $(\mathcal{M},\mathcal{B}_{\overline{\mathbb{R}}})$ -measurable.] Let  $h_k(x) = \sup_{j>k} f_j(x)$ , then  $\inf_k h_k(x) = \lim_j \sup_j f_j(x)$ . By the first argument,  $h_k$  is measurable for all k. This implies that  $\inf_k h_k(x) = \lim_j \sup_j f_j(x) = g_3(x)$  is measurable. Thus,  $g_3$  is  $(\mathcal{M},\mathcal{B}_{\overline{\mathbb{R}}})$ -measurable. [Show that  $g_4$  is  $(\mathcal{M},\mathcal{B}_{\overline{\mathbb{R}}})$ -measurable.] Similarly, let  $l_k(x) = \inf_j f_j(x)$ , then  $\sup_k l_k(x) = \lim_j \inf_j f_j(x) = g_4(x)$ . Thus,  $g_4$  is  $(\mathcal{M},\mathcal{B}_{\overline{\mathbb{R}}})$ -measurable. Finally, if  $\lim_j f_j(x)$  exists for all x, the it is the same as  $\lim_j \sup_j f_j(x) = \lim_j \inf_j f_j(x)$ , and so  $\lim_j f_j(x)$  is  $(\mathcal{M},\mathcal{B}_{\overline{\mathbb{R}}})$ -measurable.

**Corollary 2.8**: Let  $(X, \mathcal{M})$  be a measurable space, and  $f, g: X \to \overline{\mathbb{R}}$  be  $(\mathcal{M}, \mathcal{B}_{\overline{\mathbb{R}}})$ -measurable. Then,  $max\{f,g\}$  and  $min\{f,g\}$  are both  $(\mathcal{M}, \mathcal{B}_{\overline{\mathbb{R}}})$ -measurable.

Note: Let  $(X, \mathcal{M})$  be a measurable space and  $E \in \mathcal{M}$ . Then,  $\mathcal{M}_E = \{B \cap E : B \in \mathcal{M}\}$  is a  $\sigma$ -algebra of subsets of E.

Corollary 2.9<sup>+</sup>(This says more than the text): Let  $(X, \mathcal{M})$  be a measurable space, and suppose that  $f_j: X \to \overline{\mathbb{R}}$  be all  $(\mathcal{M}, \mathcal{B}_{\overline{\mathbb{R}}})$ -measurable. Then,  $E = \{x: \lim_j f_j(x) \text{ exists}\}$  is a measurable set. Moreover, if we define  $f: E \to \overline{\mathbb{R}}$  by  $f(x) = \lim_j f_j(x)$ , then f is  $(\mathcal{M}_E, \mathcal{B}_{\overline{\mathbb{R}}})$ -measurable.

Proof: Let  $E=\{x: \underset{j}{\lim} f_j(x) \text{ exists}\}=\{x: \underset{j}{\lim} \sup f_j(x)=\lim \inf f_j(x)\}=\{x: g_3(x)=g_4(x)\}=\{x: g_3(x)-g_4(x)=0\}=(g_3-g_4)^{-1}(\{0\}).$  Since  $g_3-g_4$  is  $(\mathcal{M},\mathcal{B}_{\overline{\mathbb{R}}})$ -measurable,  $(g_3-g_4)^{-1}(\{0\})=E\in\mathcal{M},$  that is E is a measurable set. On E,  $\lim_j f_j(x)=g_3(x)=g_4(x).$  So,  $\lim_j f_j(x)$  is measurable on E. Thus, if define  $f:E\to\overline{\mathbb{R}}$  by  $f(x)=\lim_j f_j(x),$  then f is  $(\mathcal{M}_E,\mathcal{B}_{\overline{\mathbb{R}}})$ -measurable.
