2012

Problem description

Previous work

- Pascal and D'Alessio [1] studied the stability of a flow with rotation and a quadratic density variation.
- Schmitz and Zimmerman [2] studied the effects of a spatially varying temperature boundary condition as well as wavy boundaries, without rotation and assuming a very large Prandtl number.
- Malashetty and Swamy [3] considered the effects of a temperature boundary condition varying in time.
- Basak et al. [4], studied the flow resulting from a spatially varying temperature boundary condition in a square cavity without rotation.

The current work takes advantage of the thinness of the fluid layer, and investigates flow in a rectangular domain with rotation and a varying bottom temperature.

2012

Governing equations and boundary conditions

Governing equations:

$$\vec{\nabla} \cdot \vec{v} = 0$$

$$\frac{\partial \vec{v}}{\partial t} + \left(\vec{v} \cdot \vec{\nabla}\right) \vec{v} + f\hat{k} \times \vec{v} = \frac{-1}{\rho_0} \vec{\nabla} p - \frac{\rho}{\rho_0} g\hat{k} + \nu \nabla^2 \vec{v}$$

$$\frac{\partial T}{\partial t} + \left(\vec{v} \cdot \vec{\nabla}\right) T = \kappa \nabla^2 T$$

Boundary conditions:

$$u = v = w = 0$$
 at $z = 0, H$ and $y = 0, \lambda$
 $T = T_0 - \Delta T$ at $z = H$ and $y = 0, \lambda$
 $T = T_0 - \Delta T \cos\left(2\pi \frac{y}{\lambda}\right)$ at $z = 0$

・ロト ・四ト ・ヨト ・ヨト

Other conditions

Initial conditions:

$$u = v = w = 0$$
, $T = T_0 - \frac{\Delta T}{H}z - \Delta T \cos\left(2\pi \frac{y}{\lambda}\right) \left(1 - \frac{z}{H}\right)$ at $t = 0$

Density is assumed to vary according to:

$$\rho = (1 - \alpha [T - T_0])$$

The flow is assumed to be uniform in the *x*-direction. This allows a stream function and vorticity to be defined as:

$$\mathbf{v} = \frac{\partial \psi}{\partial z}$$
, $\mathbf{w} = -\frac{\partial \psi}{\partial y}$, $\zeta = -\left(\frac{\partial^2 \psi}{\partial y^2} + \frac{\partial^2 \psi}{\partial z^2}\right)$

・ロト ・四ト ・ヨト ・ヨト

2012

Other conditions

Integral constraints are imposed on the vorticity and can derived using Green's Second Identity:

$$\int_{V} \left(\phi \nabla^{2} \chi - \chi \nabla^{2} \phi \right) dV = \int_{S} \left(\phi \frac{\partial \chi}{\partial n} - \chi \frac{\partial \phi}{\partial n} \right) dS$$

Here ϕ and χ denote arbitrary differentiable functions, $\frac{\partial}{\partial n}$ is the normal derivative, and S is the surface enclosing the volume V. Choosing ϕ to satisfy $\nabla^2 \phi = 0$ and letting $\chi \equiv \psi$, then $\nabla^2 \chi = \nabla^2 \psi = -\zeta$. Applying the boundary conditions $\frac{\partial \psi}{\partial n} = \psi = 0$ on S, the above leads to

$$\int_0^H \int_0^\lambda \phi_n \zeta dy dz = 0$$

where

$$\phi_n(y,z) = e^{\pm 2n\pi z} \left\{ \begin{array}{c} \sin(2n\pi y) \\ \cos(2n\pi y) \end{array} \right\} \text{ for } n = 1, 2, 3, \cdots$$

・ロト ・回ト ・ヨト ・ヨト

Scaling and dimensionless parameters

$$\begin{split} t &\to \frac{H^2}{\kappa}t \;,\; y \to \lambda y \;,\; z \to Hz \;,\; \psi \to \kappa \psi \;,\; \zeta \to \frac{\kappa}{H^2}\zeta \\ T &\to (T_0 - \Delta T) + \Delta TT \;,\; u \to \frac{\kappa}{H}u \end{split}$$

$$Ra = \frac{\alpha g H^3 \Delta T}{\nu \kappa} \text{ Rayleigh number}$$

$$Ro = \frac{\kappa}{Hf\lambda} \text{ Rossby number}$$

$$Pr = \frac{\nu}{\kappa} \text{ Prandtl number}$$

$$\delta = \frac{H}{\lambda} \text{ Aspect ratio}$$

Dimensionless equations

$$\frac{\partial \zeta}{\partial t} - \delta \frac{\partial}{\partial z} \left(\frac{\partial \psi}{\partial z} \frac{\partial^2 \psi}{\partial y \partial z} - \frac{\partial \psi}{\partial y} \frac{\partial^2 \psi}{\partial z^2} \right) + \delta^3 \frac{\partial}{\partial y} \left(-\frac{\partial \psi}{\partial z} \frac{\partial^2 \psi}{\partial y^2} + \frac{\partial \psi}{\partial y} \frac{\partial^2 \psi}{\partial y \partial z} \right) - \frac{\delta}{Ro} \frac{\partial u}{\partial z}$$
$$= \delta PrRa \frac{\partial T}{\partial y} + Pr \left(\delta^2 \frac{\partial^2 \zeta}{\partial y^2} + \frac{\partial^2 \zeta}{\partial z^2} \right)$$

$$\zeta = -\left(\delta^2 \frac{\partial^2 \psi}{\partial y^2} + \frac{\partial^2 \psi}{\partial z^2}\right)$$

$$\frac{\partial u}{\partial t} + \delta \left(\frac{\partial \psi}{\partial z} \frac{\partial u}{\partial y} - \frac{\partial \psi}{\partial y} \frac{\partial u}{\partial z} \right) - \frac{\delta}{Ro} \frac{\partial \psi}{\partial z} = \Pr \left(\delta^2 \frac{\partial^2 u}{\partial y^2} + \frac{\partial^2 u}{\partial z^2} \right)$$

$$\frac{\partial T}{\partial t} + \delta \left(\frac{\partial \psi}{\partial z} \frac{\partial T}{\partial y} - \frac{\partial \psi}{\partial y} \frac{\partial T}{\partial z} \right) = \delta^2 \frac{\partial^2 T}{\partial y^2} + \frac{\partial^2 T}{\partial z^2}$$

Approximate analytical solution

For small δ , an approximate analytical solution can be constructed:

$$\psi = \psi_0 + \delta \psi_1 + \cdots$$
, $\zeta = \zeta_0 + \delta \zeta_1 + \cdots$

$$u = u_0 + \delta u_1 + \cdots$$
, $T = T_0 + \delta T_1 + \cdots$

The leading-order problem becomes:

$$\frac{\partial T_{0}}{\partial t} = \frac{\partial^{2} T_{0}}{\partial z^{2}} , \quad \frac{\partial \zeta_{0}}{\partial t} = \Pr \frac{\partial^{2} \zeta_{0}}{\partial z^{2}} + \Pr \delta \operatorname{Ra} \frac{\partial T_{0}}{\partial y}$$
$$\frac{\partial^{2} \psi_{0}}{\partial z^{2}} = -\zeta_{0} , \quad \frac{\partial u_{0}}{\partial t} = \Pr \frac{\partial^{2} u_{0}}{\partial z^{2}}$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Approximate analytical solution

Applying the boundary, initial and integral conditions yields:

$$\zeta_0(y, z, t) = -\pi \delta Ra \left(z^2 - \frac{z^3}{3} - \frac{7z}{10} + \frac{1}{10} \right) \sin(2\pi y)$$
$$+ \sum_{n=1}^{\infty} a_n e^{-n^2 \pi^2 Prt} \cos(n\pi z)$$
$$\psi_0(y, z, t) = \pi \delta Ra \left(\frac{z^4}{12} - \frac{z^5}{60} - \frac{7z^3}{60} + \frac{z^2}{20} \right) \sin(2\pi y)$$
$$- \sum_{n=1}^{\infty} \frac{a_n}{n^2 \pi^2} e^{-n^2 \pi^2 Prt} (1 - \cos(n\pi z))$$

where

$$a_n = 2\pi\delta Ra\sin(2\pi y) \int_0^1 \left(z^2 - \frac{z^3}{3} - \frac{7z}{10} + \frac{1}{10} \right) \cos(n\pi z) dz, \quad n = 1, 2, \dots$$

Steady-state solutions

As $t \to \infty$, the following steady-state solutions emerge:

$$T_{s} = (1 - z) (1 - \cos(2\pi y))$$
$$\zeta_{s} = -\pi \delta Ra \left(z^{2} - \frac{z^{3}}{3} - \frac{7z}{10} + \frac{1}{10} \right) \sin(2\pi y)$$
$$\psi_{s} = \pi \delta Ra \left(\frac{z^{4}}{12} - \frac{z^{5}}{60} - \frac{7z^{3}}{60} + \frac{z^{2}}{20} \right) \sin(2\pi y)$$
$$u_{s} = 0$$

Plotted on the next slide are the leading-order temperature and velocities (Ro = 0.0548, Pr = 0.7046 and Ra = 388.7).

2012

Steady-state solutions

Steady-state solutions

At leading order $u_s = 0$, the $O(\delta)$ solution for u_s is:

$$u_{s} = \frac{1}{720} \frac{\pi \delta Ra}{RoPr} \sin(2\pi y) z(z-1) \left(2z^{4} - 10z^{3} + 11z^{2} - z - 1\right)$$

Transient development

v-velocity development with time for Ra = 1, Pr = 1 at times t = 0.01, 0.1, 1from top to bottom.

Transient development

w-velocity development with time for Ra = 1, Pr = 1 at times t = 0.01, 0.1, 1from top to bottom.

Steady-state numerical solutions

The steady-state solution was also be determined numerically using the commercial software package CFX. All results shown use air at 298*K* with a domain having a length of 20 cm and height of 2 cm with periodicity imposed at the ends. For cases with rotation, the angular velocity is $0.05s^{-1}$. The non-dimensional values are Ro = 0.0548 and Pr = 0.7046. The Rayleigh number will depend on ΔT .

Steady-state numerical solutions

The temperature distribution for a case without rotation or modulated bottom heating (top) is compared to a case with these effects ($\Delta T = 0.5K$, Ra = 388.7).

Steady-state numerical solutions

The velocity for a case without rotation or modulated bottom heating (top) is compared to a case with these effects ($\Delta T = 0.5K$, Ra = 388.7).

Note that the pattern and magnitude of the temperature and velocity agree well with the approximate analytical solutions.

2012

Unstable numerical solutions

$\Delta T = 0.5K, Ra = 388.7$

 $\Delta T = 4K, Ra = 3109$

Unstable numerical solutions

Unstable numerical solutions

Summary

Conclusions

- Contrary to the Bénard problem, a non-zero background flow was found.
- The approximate analytical solution agrees well with the fully numerical solution.
- While rotation is known to stabilize the flow, a variable bottom temperature also influences the stability of the flow.
- Interesting features emerging from the unstable numerical simulations were observed.
