Preface	xi
Overview	xiii
Notation Guide	xix
 Part 1. Additive Number Systems	 1
Chapter 1. Background from Analysis	3
1.1. Series and infinite products	4
1.2. Power series expansions	9
1.3. Big O, little o, and $\sim$ notation	12
1.4. The radius of convergence and RT_ρ	13
1.5. Growth rate of coefficients	15
Chapter 2. Counting Functions and Fundamental Identities	17
2.1. Defining additive number systems	17
2.2. Examples of additive number systems	21
2.3. Counting functions, fundamental identities	25
2.4. Global counts	33
2.5. Alternate version of the fundamental identity	34
2.6. Reduced additive number systems	37
2.7. Finitely generated number systems	39
2.8. $a^*(n)$ is eventually positive	43
Chapter 3. Density and Partition Sets	45
3.1. Asymptotic density	45
3.2. Dirichlet density	48
3.3. The standard assumption	51
3.4. The set of additives of an element	51
3.5. Partition sets	54
3.6. Generating series of partition sets	57
3.7. Partition sets have Dirichlet density	58
3.8. Schur's Tauberian Theorem	62
3.9. Simple partition sets	67
3.10. The asymptotic density of γP	68
3.11. Adding an indecomposable	70

Chapter 4. The Case $\rho = 1$	75
4.1. The fundamental results when $\rho = 1$	75
4.2. The Bateman and Erdős Result	77
4.3. Stewart's Sum Theorem	83
4.4. $\rho = 1$ does not imply RT_1	84
4.5. Further results on RT_1	85
Chapter 5. The Case $0 < \rho < 1$	87
5.1. Compton's Tauberian Theorem	87
5.2. When is $\delta(\mathbf{B}) = 0$?	90
5.3. The density of $\overline{\mathbf{B}}$	91
5.4. Compton's Density Theorem	92
5.5. The Knopfmacher, Knopfmacher, Warlimont asymptotics	93
Chapter 6. Monadic Second-Order Limit Laws	103
6.1. First-order logic	103
6.2. Monadic second-order logic	104
6.3. Asymptotic density of subsets of $\mathcal{K}$	106
6.4. Quantifier rank and equivalent formulas	107
6.5. Ehrenfeucht-Fraissé games	109
6.6. Adequate classes of structures	119
Part 2. Multiplicative Number Systems	125
Chapter 7. Background from Analysis	127
7.1. Series and infinite products	127
7.2. Dirichlet series expansions	133
7.3. The abscissa of convergence and RV_α	136
7.4. Growth rate of coefficients	140
Chapter 8. Counting Functions and Fundamental Identities	143
8.1. Defining multiplicative number systems	143
8.2. Examples of multiplicative number systems	144
8.3. Counting functions, fundamental identities	145
8.4. Alternate version of the fundamental identity	153
8.5. Finitely generated multiplicative number systems	156
Chapter 9. Density and Partition Sets	159
9.1. Asymptotic density	159
9.2. Dirichlet density	160
9.3. The standard assumption	164
9.4. The set of multiples of an element	164
9.5. Partition sets	166
9.6. Generating series of partition sets	169
9.7. Partition sets have Dirichlet density	170
9.8. Discrete multiplicative number systems	174
9.9. When sets $\mathbf{bA}$ have global asymptotic density	177

9.10.	The strictly multiplicative case and RV_α	181
9.11.	The discrete case and RV_α	181
9.12.	Analog of Schur's Tauberian Theorem	182
9.13.	Simple partition sets	188
9.14.	The asymptotic density of P^γ	189
9.15.	Adding an indecomposable	191
9.16.	First conjecture	194
Chapter 10.	The Case $\alpha = 0$	195
10.1.	The fundamental results when $\alpha = 0$	195
10.2.	Odlyzko's Product Theorem	196
10.3.	Further results on RV_0	198
10.4.	Second conjecture	199
Chapter 11.	The Case $0 < \alpha < \infty$	201
11.1.	Analog of Compton's Tauberian Theorem	201
11.2.	When is $\Delta(B) = 0$?	204
11.3.	The density of $\overline{B}$	205
11.4.	Sárközy's Density Theorem	206
11.5.	Generalizing Oppenheim's asymptotics	208
11.6.	Third conjecture	216
Chapter 12.	First-Order Limit Laws	217
12.1.	Asymptotic density of subsets of $\mathcal{K}$	217
12.2.	The Feferman-Vaught Theorem	218
12.3.	Skolem's analysis of the first-order calculus of classes	223
12.4.	$\mathcal{K}_\varphi$ is a disjoint union of partition classes	226
12.5.	Applications	227
12.6.	Finite dimensional structures	231
12.7.	The main problem	231
Appendix A.	Formal Power Series	233
	Real functions	233
	Polynomials	236
	Power series	240
	An identity for number systems	244
	Division of power series	245
	The composition inverse of a power series	246
	A group under composition	247
Appendix B.	Refined Counting	251
	The additive case	251
	The multiplicative case	256
Appendix C.	Consequences of $\delta(P) = 0$	261
	Bell's Positive Radius Theorem: $\delta(P) = 0$ implies $\rho > 0$	261
	Showing $\mathbf{A}(\rho) = \infty$	265

Appendix D. On the Monotonicity of $a(n)$ When $p(n) \leq 1$	269
Appendix E. Results of Woods	273
Woods' Tauberian Theorem	273
Woods' Density Theorem	277
Bibliography	281
Symbol Index	285
Subject Index	287
